Experiment 4a

Gym Membership Basic Fields

1. Aim

To design the basic data-capture forms of the Gym Membership application in Zoho Creator, namely **Membership_Plan** and **Member**, using basic field types and field-level validation, and to store sample plan records.

2. Introduction

In Zoho Creator every form is a data table, and each field on the form is a column. **Basic fields** are the simple input types used for most data entry: Single Line, Multi Line, Number, Email, Phone, Date, Radio, Drop Down, Name and Address. Each field has properties such as a field name, a link name (used in Deluge scripts), a Mandatory option, a No-duplicate-values option and an initial value.

These two forms form the base of the gym system. Membership_Plan stores the plans a gym offers, and Member stores the people who join. Later experiments link them through a Subscription form.

3. Procedure

- Opened the *gym membership* application in the Zoho Creator builder.
- Created the **Membership_Plan** form from scratch and added the fields Name, Duration_Months, Fee and Description.
- Set Mandatory on the Name and Duration_Months fields through Field Properties (Figure 1).
- Opened the live form (Figure 3) and entered three plans: Annual, Quarterly and Monthly. The saved records appear in the report (Figure 4).
- Created the **Member** form from scratch and added the fields Name, Phone Number, Email, date of birth, Gender, Address, Emergency_Contact and Join_Date (Figure 2).
- Set Mandatory on Name, Phone Number, Email, date of birth and Gender, and chose First Name and Last Name as the display parts of the Name field.
- Opened the live Member form to check the layout of the fields (Figure 5).

4. Form Design

4.1 Membership_Plan

Field	Field type	Mandatory	Notes
Name	Single Line	Yes	Plan name; maximum 255 characters; No duplicate values not ticked
Duration_Months	Number	Yes	Length of the plan in months
Fee	Currency	No	Plan fee, displayed in rupees in the report
Description	Multi Line	No	Free-text description of the plan

4.2 Member

Field	Field type	Mandatory	Notes
Name	Name	Yes	Displayed as First Name and Last Name
Phone Number	Phone	Yes	Country code selector, +91 by default
Email	Email	Yes	Email address of the member
DateDate_of_Birth (label as built)	Date	Yes	Date format dd-MMM-yyyy
Gender	Radio	Yes	Options: male, female, others
Address	Address	No	Address Line 1, Address Line 2, City / District, State / Province and further components
Emergency_Contact	Phone	No	Contact number for emergencies
Join_Date	Date	No	Date the member joined

5. Screenshots and Observations

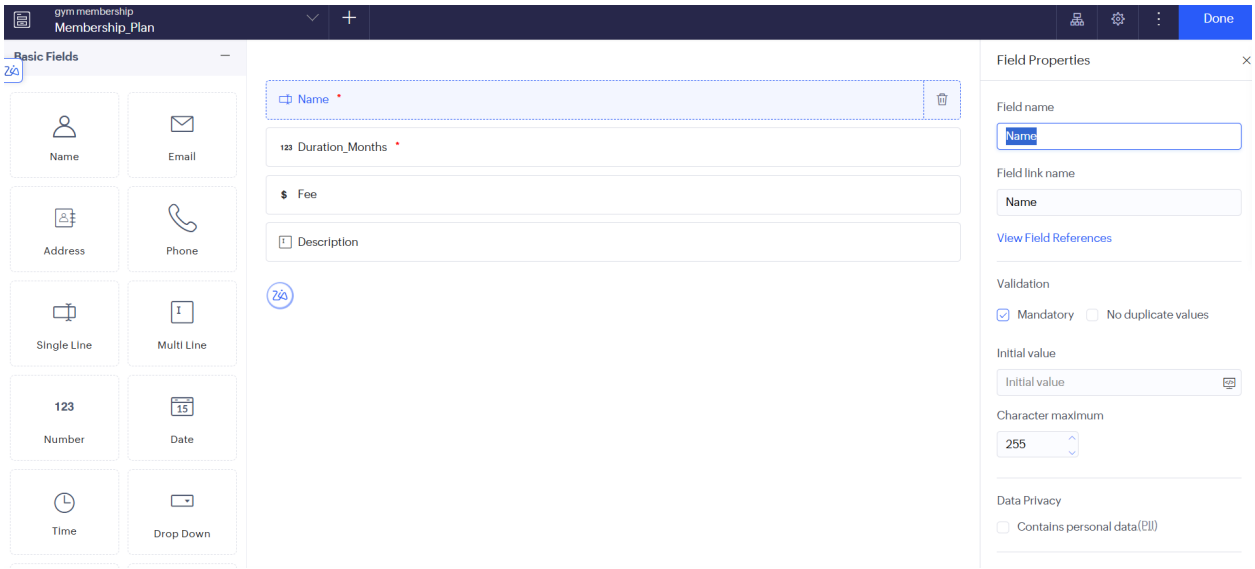

Figure 1: Membership_Plan form in the builder. The Field Properties panel for the Name field shows Mandatory ticked and No duplicate values unticked.

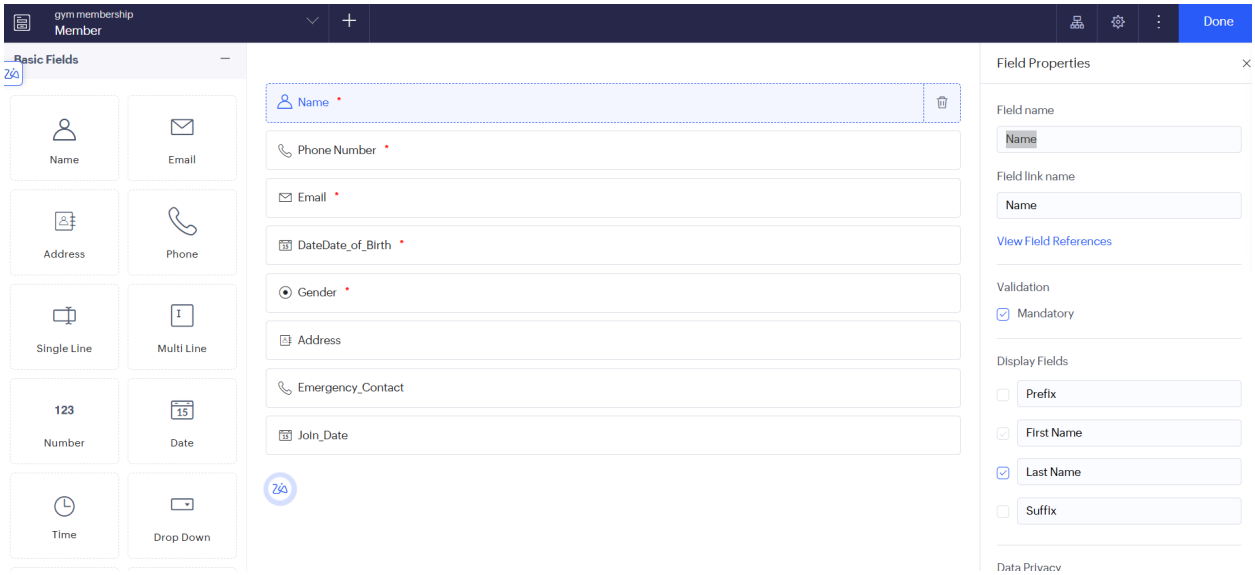

Figure 2: Member form in the builder. The Name field properties show Mandatory ticked, with First Name and Last Name as display fields.

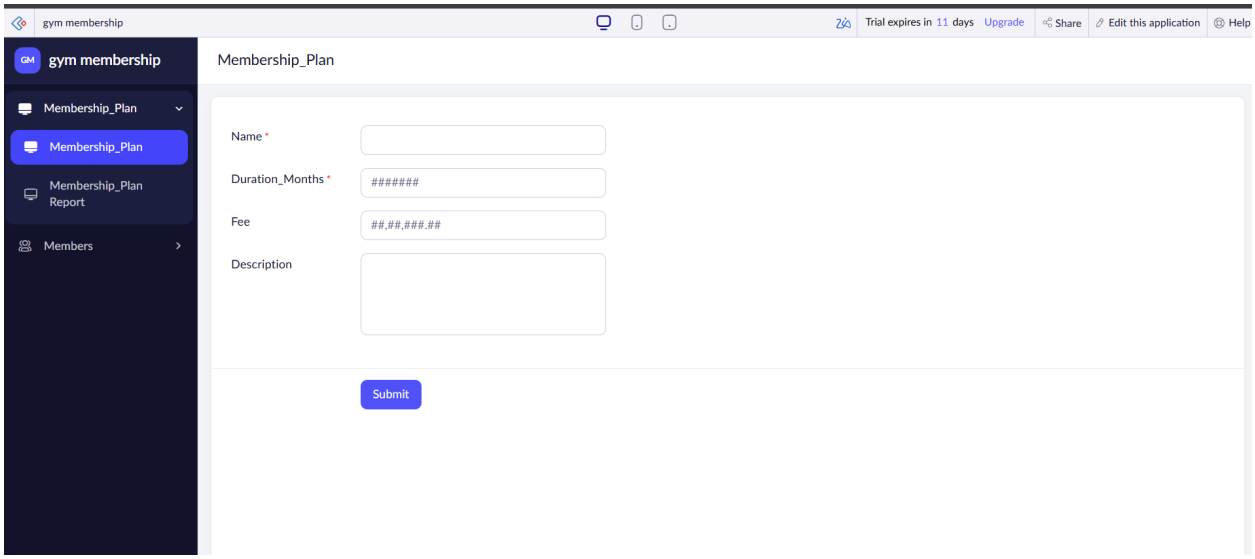

Figure 3: Live Membership_Plan form with the fields Name, Duration_Months, Fee and Description. Mandatory fields carry a red asterisk.

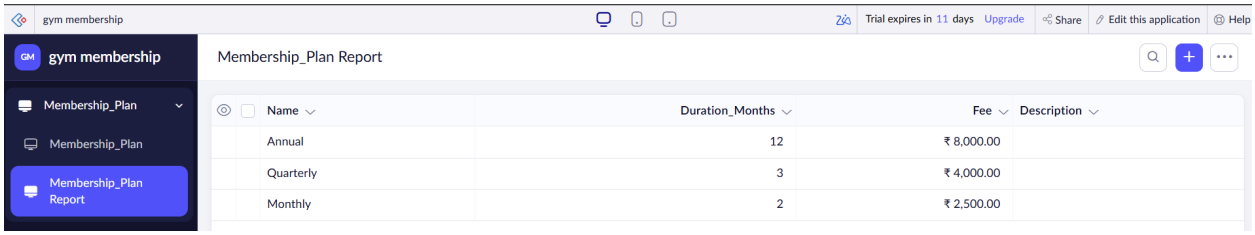

Figure 4: Membership_Plan report showing the three saved plans.

Plan	Duration (months)	Fee
Annual	12	8,000.00
Quarterly	3	4,000.00
Monthly	2	2,500.00

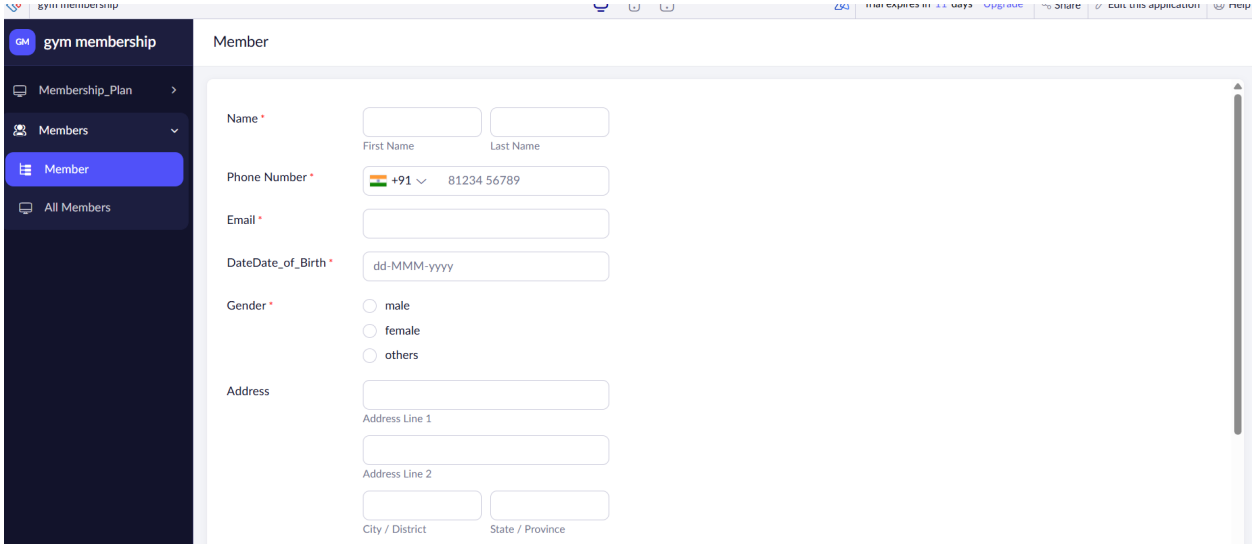

Figure 5: Live Member form showing Name (first and last), Phone Number with +91, Email, date of birth, Gender radio buttons and the Address field.

6. Discussion

Choosing the correct field type gives built-in checking without code. The Number field accepts only digits for Duration_Months, the Email field checks the address format, the Date field uses a date picker, and the Radio field limits Gender to the listed options. The Mandatory option stops a record being saved when a required field is empty, which is shown on the live forms by the red asterisks.

The Name and Address fields are composite fields made of several parts, so the data is stored in a structured way instead of as one long text value. Field link names, visible in Field Properties, are the names used later in Deluge scripts, so they should be clear and consistent.

7. Result

The Membership_Plan and Member forms were created with basic fields and mandatory validation, both forms were opened as live forms, and three plan records were saved and listed in the Membership_Plan report.

Evidence boundary: the screenshots show the form designs, the live forms and the saved plan records. Tests of duplicate-value checking, the behaviour when a mandatory field is left empty, the Join_Date initial value and sample Member records are not captured in this record and remain pending.
